

Some significant differences identified in “usual care” for post-stroke gait rehabilitation in Norway

Usual Care for Inpatient Stroke Rehabilitation in Norway: Is It “Usual”?

INTRO

- Usual care (UC): Routine care received by patients for prevention or treatment of diseases
- Purpose: For patients undergoing stroke rehabilitation and have goals to recover walking:
 - Identify the level of function of patients at admission to inpatient stroke rehabilitation in Norway
 - Characterize the amount of stepping activity and heart rates achieved during UC
 - Describe the outcomes of UC physiotherapy (PT)
 - Determine if differences in these factors exist between 6 facilities in Norway

METHODS

- Six Norwegian inpatient rehabilitation hospitals (Table 1)
- Observational design, occurred as phase one of multi-center implementation project (FIRST project)
- Inclusion criteria:
 - Undergoing stroke rehabilitation for stroke
 - Goal of improving walking function
- Exclusion criteria: FAC = 5; medically unstable
- Assessments (see tables 2, 3, 4)

RESULTS

- 208 patients were recruited with admission characteristics in Table 1
 - Significant differences* in length of stay, age, and duration post-stroke for subacute patients ($p < 0.001$)
 - No significant differences in admission level of function, however, clinically meaningful differences in scores noted
- Stepping activity* was significantly different (Table 3, orange)
- Heart rate data provided by two sites indicate minimal time spent in the target heart rate zone (Table 3)
- Outcome measurement changes: Significant differences* ONLY in the 6 MWT between 2 sites (Table 4)

DISCUSSION

- Significant differences between facilities were noted in admission characteristics, length of stay, stepping activity, and 6MWT outcomes.
- Admission level of function of patients post-stroke is substantially higher than reported in other countries (Table 5)
- These data provide information that could be valuable as baseline data for quality improvement and for developing UC protocols for studies

Abbreviations: 6 Minute walk test (6MWT), Berg Balance Scale (BBS), Fast velocity (FV), Functional Ambulation Category (FAC), Heart rate (HR); Not available (NA); Physiotherapy (PT), Self-selected velocity (SSV) Usual care (UC)
